Act on End-of-Life Assets with the Rule Engine

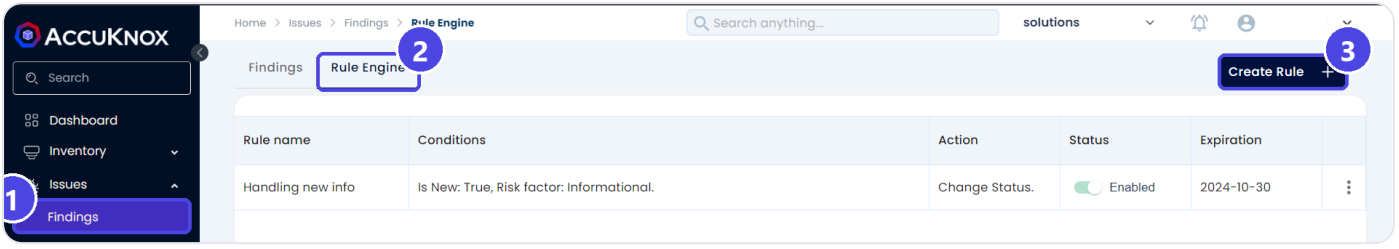

Set one rule. AccuKnox opens a ticket or sends an alert each time it finds an end-of-life (EOL) asset.

1. Pick the condition
Choose `Is EOL` in a Rule Engine rule. Add more conditions, such as a new asset or a severity count above a limit.

2. Choose the action
Create ticket in a connected ticketing integration, or **Send to notification channel**.

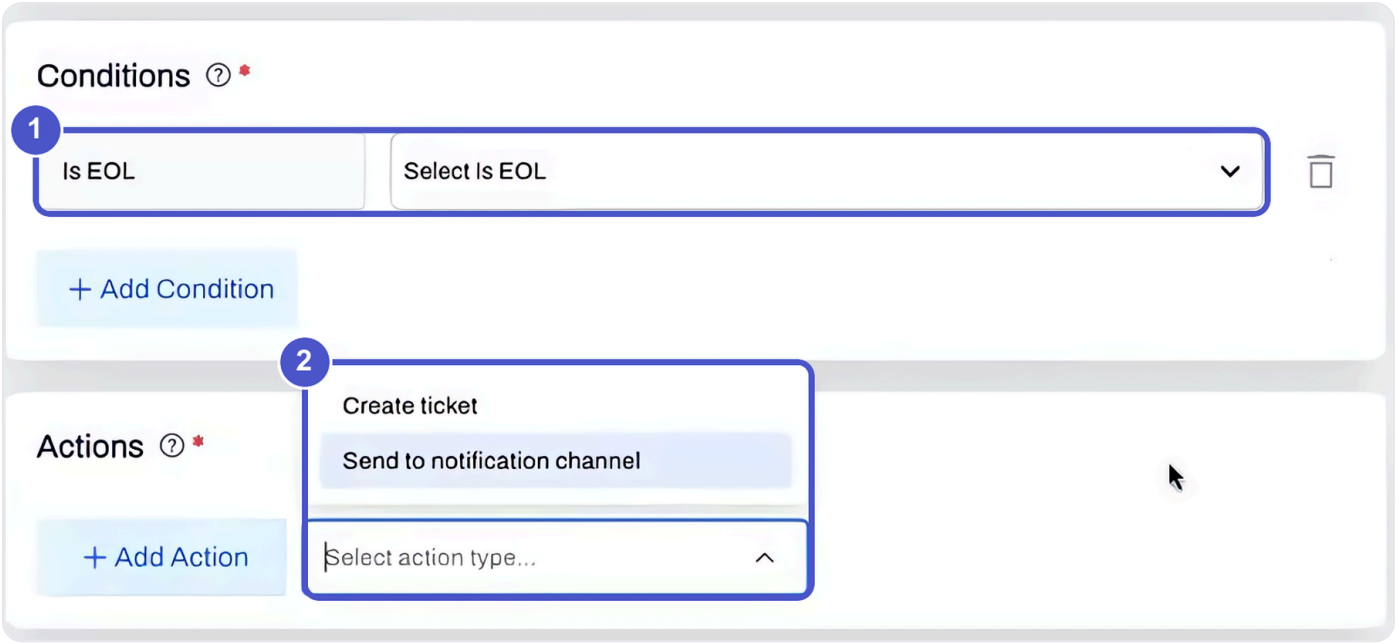

3. Let it run
The rule runs each time AccuKnox parses an asset file. You schedule nothing.

1 OPEN ISSUES → FINDINGS → RULE ENGINE → CREATE RULE

(1) Findings in the Issues menu. (2) The Rule Engine tab. (3) The Create Rule button.

2 CHOOSE IS EOL, THEN PICK AN ACTION

(1) The **Is EOL** condition under Conditions. (2) The two actions in the Actions list.

HOW THE RULE BEHAVES

- A rule never files the same ticket twice. If a ticket exists for the asset, later triggers send a notification only.
- Asset tickets have their own template under **Settings**.
- **Prerequisite:** connect a ticketing or notification integration first.

> **Also in the docs:** the container scan FAQ lists **Outdated Base Images**, meaning images built on EOL base OS versions with unpatched CVEs. The docs apply EOL to an asset or a base OS, not to a single package.
