AccuKnox

Orca finds risk. AccuKnox finds it and stops it.

AccuKnox vs Orca Security

Zero Trust CNAPP evaluation for Jubilee Insurance

Prepared for Jubilee Insurance · October 2026 · Evidence: Jubilee RFP, AccuKnox proposal, and public Orca pages

AccuKnox Matches Orca on Posture and Adds Runtime Prevention

Jubilee asked for 94 requirements across cloud, workload, Kubernetes, application, identity and AI security. AccuKnox answered 86 as fully compliant, 7 as partial and 1 as roadmap. All 8 CIEM requirements sit in the partial and roadmap group. Slide 7 shows that plan.

Orca Security is a strong agentless posture platform. Both products onboard without agents and cover AWS, Azure and Oracle Cloud. The two differ in what happens after a finding.

Pick AccuKnox to:

- Block a threat on the workload before the action completes.
- Enforce policy on prompts, models and agents, not only inventory them.
- Host your tenant in the Europe or Middle East region you choose.
- Run code, cloud, Kubernetes, workload and AI security from one control plane.

The tally across 12 rows: 4 AccuKnox leads, 6 parity, 2 Orca leads today. Identity (CIEM) and data security (DSPM) are the 2 Orca leads, and slides 7 and 8 cover both.

Jubilee Asked for One Console, Identity Depth and Governed AI

Each point below comes from Jubilee's own RFP and the AccuKnox proposal dated 10 August 2026.

WHAT JUBILEE ASKED FOR	WHERE IT APPEARS
One console across Azure, AWS and OCI	GEN002 and NFR-ARCH-002
Eight identity requirements, all mandatory	CIEM-001 to CIEM-008
Ten AI security requirements, all mandatory	AI-001 to AI-010
Reports on CIS, NIST, PCI DSS and ISO 27001	CSPM-010
A regional tenant, and a possible Kenya or East Africa residency mandate	Proposal section 7.1
24×7 support for Severity 1 incidents, plus a technical account manager	NFR-SUP-001 and NFR-SUP-002
Insurance or financial services experience	RFP submission checklist

Orca Scans From Outside the Workload and AccuKnox Also Enforces Inside It

Orca reads cloud configuration and workload block storage out of band, with no agent (Orca CWPP). Runtime detection comes from a separate component, the Orca Sensor (Orca Sensor).

AccuKnox scans the cloud agentlessly with read-only roles. It then adds KubeArmor, an open source CNCF runtime engine that AccuKnox created. KubeArmor enforces policy in the kernel on Kubernetes and VM workloads (AccuKnox architecture).

LAYER	ORCA SECURITY	ACCUKNOX
Cloud posture	Agentless SideScanning	Agentless, read-only roles
Workload runtime	Orca Sensor detects, and can terminate processes	KubeArmor blocks the action before it completes
Identity	CIEM with policy optimizer and just-in-time access	CIEM with identity graph and risk classes
Data	DSPM across cloud data stores	DSPM scanner that runs in your region
AI	AI-SPM, plus Sensor detection of AI activity	AI-SPM, Prompt Firewall, ModelArmor sandbox

Why Customers Choose AccuKnox Over Orca Security

AI security that enforces. The Prompt Firewall inspects each prompt and response and blocks injection inline (Prompt Firewall). ModelArmor confines agents and ML workloads at runtime (ModelArmor).

One integrated platform. The proposal runs CSPM, CWPP, KSPM, ASPM, AI security, CDR, API security and GRC on one control plane. Static posture and runtime enforcement share one policy engine and one data schema.

Support and availability that Jubilee can hold in writing.

- Platinum support runs 24×7 with a named Customer Success Manager.
- P1 first response takes 1 hour, with updates every 2 hours.
- Service credits start when monthly uptime drops below 99.9%.
- Recovery time objective is 6 hours and recovery point objective is 24 hours.
- Runtime enforcement keeps running through a control plane outage because the KubeArmor agents enforce locally and fail secure.

AccuKnox Leads 4 Rows, Matches Orca on 6 and Trails on 2

Every Orca cell links to a page Orca published. Orca's documentation portal requires a login, so all Orca facts come from its public product pages, read on 13 October 2026.

CAPABILITY	ACCUKNOX	ORCA SECURITY	STATUS	BUYER TAKEAWAY
Unified platform	CSPM, CWPP, KSPM, ASPM, AI security, CDR, API security and GRC share one control plane. Architecture	CSPM, CWPP, CIEM and DSPM sit in one platform. Orca CWPP	Parity	Both avoid a stack of point tools
Cloud coverage	AWS, Azure, GCP and OCI from one console. Cloud regions	AWS, Azure, Google Cloud, Kubernetes, Alibaba Cloud and Oracle Cloud. Orca compliance	Parity	Jubilee's three clouds are covered
Cloud posture onboarding	Agentless and read-only. The first inventory scan needs one account, one role and about 2 hours. Deployment models	SideScanning collects data out of band and deploys in minutes, by Orca's account. Orca CWPP	Parity	Both start without agents
Runtime workload protection	KubeArmor enforces in the kernel with eBPF and LSM and blocks the action before it completes. Enforcement continues through a control plane outage. CWPP	Orca Sensor uses eBPF to detect threats, and detections can terminate processes. Blocking before execution is not shown. Orca Sensor	AccuKnox leads	Blocks the action before it completes
Kubernetes and containers	KSPM, in-cluster image scans, RBAC analysis, and admission control with KnoxGuard. KnoxGuard	Agentless image, registry and control plane checks, with guardrail policies against insecure deployments. Orca Kubernetes	Parity	Admission control plus runtime enforcement
Application security	ASPM covers SAST, DAST, secrets, IaC and SBOM. ASPM	SCA, SAST, secrets, IaC and container image scanning. DAST does not appear on its application security page. Orca AppSec	AccuKnox leads	Tests the running application too

Six More Rows Cover AI, Identity, Data, Compliance, Policy and Regions

CAPABILITY	ACCUKNOX	ORCA SECURITY	STATUS	BUYER TAKEAWAY
AI security	The Prompt Firewall blocks injection inline. ModelArmor sandboxes agents. Model file scans and a CycloneDX AI BOM add depth. Prompt Firewall and AI/ML support matrix	AI-SPM inventories models and 50+ AI packages and flags exposed AI keys. Sensor detects prompt injection patterns. Inline blocking is not shown. Orca AI-SPM and Orca AI security	AccuKnox leads	Enforces policy beyond AI inventory
Identity and entitlements (CIEM)	Lists users, groups and roles on AWS, Azure, GCP and OCI. Shows policies, risk classes, last use and an access graph. Standalone accounts only today. CIEM overview	Adds a policy optimizer based on 90 days of usage, just-in-time access for AWS, and exposed key discovery. Orca CIEM	Orca leads	Plan on slide 7 closes the gap
Data security (DSPM)	The scanner runs in your region with read-only access, and only a findings file leaves. Reads images with OCR. DSPM overview	Discovers and classifies data across cloud stores, including images with OCR, and scans managed and shadow data. Orca DSPM	Orca leads	Data stays in the region you pick
Compliance reporting	40+ frameworks with control-level mapping, including CIS, NIST 800-53, ISO 27001 and PCI DSS. Custom frameworks and scheduled, versioned reports. Compliance matrix	150+ frameworks, custom frameworks, and scheduled reports in CSV, JSON and PDF. Orca compliance	Parity	All four named frameworks are covered
Policy setup effort	Application Behavior learns each workload and drafts least-permissive policies. Policies run in audit mode for 2 to 3 weeks before enforcement. App behavior	Thousands of built-in alert templates, a query builder and natural-language queries. Orca CIEM	Parity	Enforcement policies drafted from observed behavior
Hosting regions and residency	Four SaaS regions: US, Europe, Middle East and India. Hard isolation with dedicated instances is available. On-prem and air-gapped deployments exist. Deployment models	Its documentation portal lists seven regions: US Global, Europe, Australia, India, South America, Indonesia and GOV Cloud. No Middle East or Africa region appears. Orca docs portal	AccuKnox leads	Host in the Europe or Middle East region you choose

Status key. AccuKnox leads means AccuKnox ships it and the Orca page shows a gap. Parity means both ship it with no meaningful gap. Orca leads means Orca ships more today.

Five Objections Have Documented Answers

OBJECTION	WHAT THE DOCUMENTS SHOW
"Agentless coverage is enough."	Orca's own page says its Sensor shows which vulnerable packages actually execute at runtime (Orca Sensor). Runtime behavior needs a runtime component, and AccuKnox adds enforcement to it.
"Orca has deeper identity controls."	True today for the policy optimizer and just-in-time access. Slide 7 lists what AccuKnox ships and what comes next.
"A smaller vendor adds risk."	AccuKnox holds a SOC 2 Type II report and has completed an ISO/IEC 27001:2022 audit. It secures 200+ cloud accounts and is awardable on the US Department of Defense Platform One and Tradewinds marketplaces.
"Policy setup will take months."	Policies run in audit mode first, so Jubilee sees what would have been blocked. Production coverage lands by the end of Week 3.
"Orca covers AI security too."	Orca documents AI inventory, posture and detection. AccuKnox adds inline prompt blocking, agent sandboxing and model file scans. Row 7 shows the sources.

CIEM Ships in v3.7 With Four Clouds and a Defined Next Step

Jubilee's RFP marks CIEM as partial on 7 requirements and roadmap on 1. This slide separates what AccuKnox ships from what comes next.

ITEM	STATUS	SOURCE
Discover users, groups and roles on AWS, Azure, GCP and OCI	Ships in v3.7 **[FILL: confirm v3.7 general availability date with Product]**	v3.7 release notes
Classify each identity as human or machine	Ships in v3.7	CIEM overview
Show attached policies, risk classes and last use	Ships in v3.7	CIEM overview
Draw the access graph from identity to groups to policies	Ships in v3.7	CIEM overview
Organization-level accounts	Planned for the release after v3.7	v3.7 release notes
Privileged account activity monitoring (CIEM-007)	Roadmap **[FILL: target release from Product]**	Jubilee RFP response
Scored least-privilege recommendations	**[FILL: scope and date from Product]**	Jubilee RFP response

Where Orca leads today. Orca ships a policy optimizer and just-in-time access for AWS. AccuKnox CIEM ships neither today.

Action plan for Jubilee.

1. Onboard Jubilee's cloud accounts as standalone accounts with the CIEM toggle on. CIEM does not support organization accounts yet.
2. Enable CloudTrail on AWS first, because the last-use data comes from it.
3. Review the identity list and risk classes in the Week 0 baseline report.
4. Receive the dated roadmap commitments for the three open rows in writing.

DSPM Keeps Jubilee's Data Inside Its Own Region

The AccuKnox DSPM scanner runs on a machine Jubilee owns, in the region that holds the data. It reads with read-only access, classifies in memory and sends only a findings file to the console (DSPM overview).

ITEM	DETAIL
Supported today	Amazon S3, Azure Blob Storage and ADLS Gen2, RDS and Aurora, Azure SQL, Cosmos DB, DocumentDB, self-managed PostgreSQL, MySQL, MariaDB, SQL Server and MongoDB, Google Workspace Drive and Salesforce
Schedule	Nightly per data store
File formats	Documents, spreadsheets, Parquet, archives and images through OCR
Not supported today	Google Cloud Storage, SMB or NFS shares, Oracle Database and data warehouses such as Snowflake
OCI	OCI Object Storage does not appear in the supported list **[FILL: roadmap commitment from Product]**
Findings in the console	The DSPM dashboard shows alerts by severity, findings trends and open tickets **[FILL: confirm findings join the cloud attack path view]**

Where Orca leads today. Orca documents DSPM across AWS, Azure and Google Cloud storage, plus shadow data discovery (Orca DSPM).

Action plan for Jubilee.

1. Deploy one scanner VM in each region that holds regulated data.
2. Scope the first scan to S3 buckets, Blob containers and the main databases.
3. Triage the first findings file in the weekly working session.
4. Receive a dated commitment for OCI data stores in writing.

Jubilee Reaches Production Coverage in 3 Weeks

The pricing sheet accompanies the proposal. This slide covers the levers that move cost, using facts from the proposal.

LEVER	FACT
Time to first inventory	One cloud account, one read-only role and about 2 hours of Jubilee's cloud team
Time to production	Remaining accounts, clusters and VMs onboard in waves by the end of Week 3
Blocking risk	Policies run in audit mode for 2 to 3 weeks before any enforcement
Audit effort	One assessment cycle produces evidence for several frameworks at once
Resilience	Recovery time objective is 6 hours and recovery point objective is 24 hours
Support	Platinum tier includes 24×7 support, live training and a named Customer Success Manager

Five questions that make any two quotes comparable. Ask every vendor for a written answer to each.

1. Which modules does the quote include for identity, data security, runtime protection and AI security?
2. Which regions host the tenant, and where does Jubilee's data stay?
3. Which support tier carries 24×7 Severity 1 coverage, and what does it cost?
4. How does the price change as assets grow beyond the agreed count?
5. What service credits apply when monthly uptime drops below 99.9%?

Two of Three Named References Sit in Insurance or Financial Services

CUSTOMER	SECTOR	OUTCOME
Prudent Insurance Brokers	Insurance	Cloud and Kubernetes posture across a regulated insurance broking estate
Alice Blue	Financial services	Posture and compliance reporting for a high-transaction trading platform
FairFirst Insurance	Insurance	Application security in a fully on-prem, air-gapped regulated environment
IDT Telecom	Telecom	89% improvement in uptime after runtime hardening and policy enforcement

AccuKnox releases reference contact details with each customer's written consent.

Credentials.

- SOC 2 Type II report from Infoguard Cyber Security, Inc., covering 1 January 2026 to 31 December 2026.
- ISO/IEC 27001:2022 audit completed by the same auditor.
- Kubernetes Certified Service Provider, CNCF Silver Member, and AWS EKS Ready partner.
- KubeArmor has passed 2 million downloads and 1,000+ GitHub stars.
- Customers rate AccuKnox 4.5 out of 5 on Gartner Peer Insights and 4.3 out of 5 on G2.

Verify AccuKnox on Your Own Accounts by Week 1

1. **Week 0.** Agree success criteria in writing and issue the IAM and network prerequisites.
2. **Week 0.** Onboard one cloud account and review the full asset inventory and baseline scores.
3. **Week 1.** Apply runtime policies in audit mode and test an AI detection and response remediation on a controlled event.
4. **Week 1.** Review the dated CIEM and DSPM commitments from slides 7 and 8 with your team.
5. **Weeks 2 to 4.** Roll out in waves, connect your SIEM and ticketing, and sign the handover checklist.

Call to action. Confirm the Week 0 kickoff date with your AccuKnox account team. The proposal stays valid for 90 days from 10 August 2026.

AccuKnox Answered 86 of 94 Requirements as Fully Compliant

The table below reproduces the section tally and the eight CIEM rows from the RFP workbook dated 10 August 2026. C means compliant. PC means partially compliant. F means future roadmap.

RFP SECTION	REQUIREMENTS	C	PC	F
General platform	10	10	0	0
CSPM	10	10	0	0
CWPP	10	10	0	0
ASPM	5	5	0	0
CIEM	8	0	7	1
Kubernetes and container	8	8	0	0
Serverless	5	5	0	0
AI security (AI-SPM and AIDR)	10	10	0	0
Reporting and dashboards	5	5	0	0
Non-functional	23	23	0	0
Total	**94**	**86**	**7**	**1**

The Eight CIEM Rows Show Seven Partial and One Roadmap

REF	REQUIREMENT	FINAL COMPLIANCE
CIEM-001	Discover all human and nonhuman identities.	PC
CIEM-002	Identify excessive permissions.	PC
CIEM-003	Detect dormant identities and unused privileges.	PC
CIEM-004	Identify toxic combinations of permissions.	PC
CIEM-005	Support least-privilege recommendations.	PC
CIEM-006	Identify privilege escalation paths.	PC
CIEM-007	Monitor privileged account activity.	F
CIEM-008	Provide identity risk scoring.	PC
